PC Clock Timing is a lightweight and very practical application that shows the resolution of various system time calls on any Windows system, as well as their overall speed. How to use PC Clock Timing To get started with PC Clock Timing, users simply have to download the archive, unzip it, and run the application using its default executable file. Once launched, the app will display the “performance counter frequency” by default. To populate the rest of the interface, users are required to simply press the “Refresh” button located on the lower left side of its main window. Subsequently, users are presented with a lot of useful information such

as the clock speed from TDTSC (in Mhz), the time for GetTickCount call, the time for QueryPerformanceCounter call, the CPU speed, the TimeAdj, and TimeIncr, the timer resolution, the Time for timeGetTime call, the timeGetTime resolution, the time for now call, the get TickCount resolution, and finally the GetSystemTimeAsFileTime resolution. Use the Plot function to get a clear view of the successive calls The Plot function is designed to display the intervals required between successive calls to GetSytemTimeAs FileTime. The application also provides users with the option to automatically start the scanning process with this plot. By opting for the MM Timer function, users can also view the GSTAFT

resolution and how many “clean” intervals it derives from. Small and efficient utility for showing system time calls on Windows To conclude, PC Clock Timing is a very easy to use, lightweight, and practical application that allows users to get a detailed view of various important system time calls of their computer’s Windows systems. The application does not require any type of pre-configuration and can be installed on any Windows computer, even those with running very old version of the OS.

Graph. The CPU Graph displays the total duration of each call to `GetTickCount`, `QueryPerformanceCounter`, and `GetSystemTimeAsFileTime`, depending on the system CPU speed. You can select the “CPU Speed” graph if you want to get better resolution. This graph enables you to select the speed of the graph based on the selected frequency. You can also change the graph’s color to get a clear view To select the CPU Graph, right-click on its icon and select CPU Graph to open its configuration window. To find out the current graph mode, select the Current graph option in the drop-down menu. The display will be changed to the CPU Graph mode by default. Now, select the “CPU” mode by scrolling down the
